
DiagBox V6.01 And V6.24 Upgrade Multilingual

NET V4.0 was not working. So I did some searches online and finally found out that this problem is caused by the new characters for the Windows codepage and other languages. Thanks to Alan, I found the solution on his site and it works perfectly. Finally, we have the international phone book for Windows ME (and 2000 and NT): Phonebook v6.06. DOWNLOAD: Alan Thomas of has posted this little program in his web site. This program will detect the extensions of your PC, your version of Windows (for both Windows NT and Windows ME) and your language. The program works like this: You need to put your CD into the drive and launch the file Phonebook for V6.06 or Phonebook for V6.25. The first time you start this program you need to run it with administrative rights. After running this program, you will have some information on your screen: The name of your computer, your version of Windows and your language. It also detects the language of your keyboard. I recommend that you restart your computer after you run the program, as the program is not saved in the computer's registry, so there is no need to reboot. DOWNLOAD: At the beginning of the year, I ran an upgrade CD for Lexia 5. My customer told me that the new version of DiagBox V6.06 did not work. After checking online, I realized that the problem is related to the new Microsoft internet explorer version. So I told him that we had an internet solution. I also told him that I could put an IE button on my web site that would show the user the version and the last IE version used by his computer. This is the link for the IE button and it is at (I forgot to change the name of my site). I also have a short text describing what the button does. DiagBox V6.06 And V6.25 Upgrade Multilingual
DOWNLOAD: I was contacted by an engineer from France and he was looking for a solution to his problem with the new version of DiagBox V6.25. He told me that
