The most popular ones include: Checkers, Solitaire, FreeCell, Bejeweled, Mahjong, Risk, and Trivia Pursuit. References Category:Aiming guides Category:Android (operating system) software Category:Windows Phone software

Among mammals, behavioral thermoregulation is an essential aspect of mammals' survival, in addition to maintaining homeostasis through biochemical and physiological processes. While it is generally thought that the endothermic regulation of temperature in mammals is controlled by hypothalamic thermogenesis, the presence of cold- and heat-sensing neurons and their role in the cold-defense system, and the role of the central endothermic system in the regulation of behavior have been the subject of extensive studies. Behavioral thermoregulation is an essential aspect of mammals' survival, in addition to maintaining homeostasis through biochemical and physiological processes. While it is generally thought that the endothermic regulation of temperature in mammals is controlled by hypothalamic thermogenesis, the presence of cold- and heat-sensing neurons and their role in the cold-defense system, and the role of the central endothermic system in the regulation of behavior have been the subject of extensive studies. However, there is still much to be learned about the physiological and behavioral aspects of the process of thermoregulation. Thermoregulation during behavioral changes is essential for survival, and a series of defense mechanisms are used for thermoregulation during flight and escape. For instance, behavioral thermoregulation is necessary for flight and escape and it has been known that to fly or to run under warm conditions, insects maintain a high body temperature ([@B10]). In other mammals, the response to a shift in thermal environment is not limited to movement in an attempt to escape from the thermal stress but also includes other behaviors, such as flight. 2d92ce491b
